

**ABSTRACT**

5       Gas cylinder with two concentric bodies and an intermediate chamber,  
with a control rod and gas passage valve that withstands multidirectional drive  
action, enabling the drive action on an area that resembles a semi-sphere and  
with the direction in which the executing force of the control action is applied  
proving immaterial, as it can be either on the rod itself or on a device attached  
to its end with a blind hole or through hole.
